# MD & HD Series

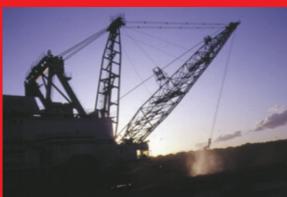

All Models .....for Industrial Applications

## MD & HD Series - Internal Gear Pumps

Engineered in Australia

The EBSRAY MD & HD Series of Internal Gear Pumps are a range of medium and heavy duty, positive displacement pumps suitable for handling a diverse variety of products covering a wide range of viscosities, temperatures, flows and pressures.

### Fields of Application

EBSRAY Internal Gear Pumps are widely used and preferred in numerous and diverse industrial pumping applications including:

Petroleum/fuel oil industry.

Plastics manufacture.

\* Paint manufacturing.

III Road tanker liquids transfer. III Public utilities.

Bitumen road sealing.

Defence.

Heavy industry.

Power stations.

Food processing.

Mining Industry.

### **Features**

- ✓ Reliable operation time proven principle
- ✓ Rugged Heavy Duty construction.
- ✓ Ease of maintenance only two major moving pumping elements.
- ✓ Optional standard configurations and builds available to suit a wide range of applications.
- Quiet operation.
- ✓ Integral and In-Line Relief/Bypass Valves.
- ✓ Low NPSH<sub>R</sub> capability.

### Special Constructions

Contact EBSRAY or your local Representative for advice on alternate arrangements to meet applications not outlined in this publication.

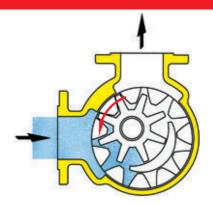

### Assured Quality and Performance

EBSRAY's ISO 9001 Quality System assures compliance with high safety and quality standards.

All Ebsray MD & HD Series pumps & pumpsets are manufactured under strict guidelines and procedures.

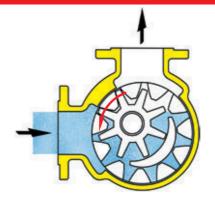

Quality inspections and tests during production guarantee pump integrity and pumping performance in accordance with the specifications.

## **Pumping Principle**

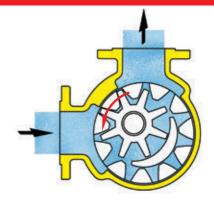

### 1. Induction (Inlet)

As the Outer Rotor rotates, the Inner Rotor is driven in the same direction. The volume between the teeth increases as the rotor teeth move out of mesh, creating a partial vacuum. The resultant reduction in differential pressure causes the liquid to enter through the inlet port, filling the space between the teeth of the two rotors.

### 2. Transfer

While rotation continues, the liquid between the rotor teeth is carried towards the discharge port. During this transfer stage, the inside of the Outer Rotor teeth and the outside of the Inner Rotor teeth are sealed by the Crescent. The Rotors are also sealed between the bore of the pump Body (Casing) and the Cover.

### 3. Discharge

Once past the Crescent, the teeth begin to move into mesh again, reducing the volume between the two rotors and thereby forcing the liquid from the tooth cell and out of the pump via the discharge port. Flow is smooth and continuous.

### Major Benefits of EBSRAY MD & HD Series Pumps

- ✓ Only two major moving pumping elements.
- Excellent self priming and vapour-clearing ability.
- Smooth even flow without pulsation or surging.
- Ideal pumping principle for either viscous or non-viscous liquids.
- ✓ High overall efficiency.

- Reversible operation.
- Negligible axial thrust due to hydraulic balance.
- ✓ High pressure capability.
- Cushioned positive flow movement of liquids.
- The principle tends to be self compensating for wear, allowing for normal predictable operation over an extended service life.

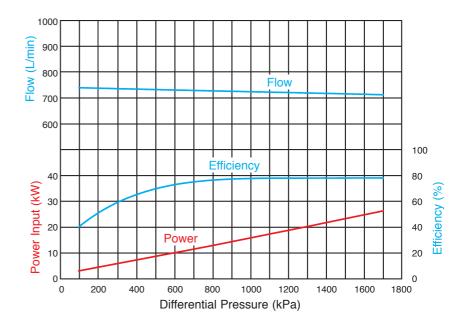

### Pump Efficiency

Being of the "Internal Gear Principle", all EBSRAY MD & HD Series pumps will operate efficiently over a wide range of pressures, viscosities and speeds.

A typical illustration is shown in the graph opposite. The graph shows typical performance of HD Series pump model HD300.

Speed = 300 RPM Kinematic Viscosity = 63 cSt.

# **Applications**

Fully jacketed HD Series pump fitted with cartridge mount mechanical seal on 24 hour pitch recirculation service in Aluminium smelter. These pumps replaced opposition manufactured pumps running at identical speeds which needed complete reconditioning every 6 months. The Ebsray replacement pumps have needed only minor maintenance every three years!

Special MD Series Stainless Steel API 676 compliant pumpsets fitted with double cartridge mount mechanical seals and pressurised barrier liquid tanks for ABS/SAN chemical process plant.

Model MD 200 pumpsets installed in a modern environmentally friendly, high efficiency oil and solvent transfer installation.

Heavy Duty Grease transfer pump in a major lubricant blending plant where all pumps were designed, manufactured and supplied by EBSRAY.

## **Applications**

Heat traced crude oil pumps for rail tanker unloading service fitted with cartridge style mechanical seals and spacer couplings for ease of maintenance. These pumps discharge 1,000,000 litres per day through 2.5 kilometres of heat traced discharge line. The system also incorporates EBSRAY In-Line type Bypass Valves for protection from excessive pressure rise.

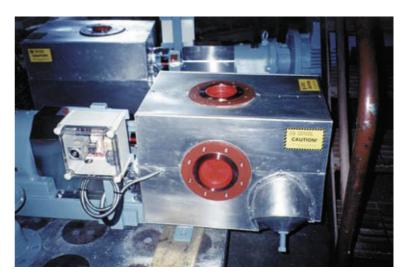

Two of six crude palm oil transfer pumps for tanker unloading in palm oil refinery. These pumps have been in continuous service for 15 years with virtually no maintenance required.

Oil recirculating pump for critical lubrication duty on a rock crusher. Hundred of EBSRAY pumps are used in this application throughout the Mining and Quarrying industries where reliability, low noise level, and long service life are the prime selection criteria.

Factory fitted fully electric heat traced and lagged Model MD 300 bitumen pumps with automatic temperature sensing and control.

## Relief Valves & Baseplates

Ebsray manufacture a large range of Integral (bolt-on) Relief Valves for pump or system protection to suit all pumps in the MD & HD range. Ebsray also manufacture In-Line Bypass Valves and special purpose valves to suit many different pumping applications.

### Integral Relief Valves

Designed for direct mounting (bolt-on) to the pump Cover providing protection against excessive differential pressure rise in the pump and system. These fully adjustable Relief Valves are designed to handle full flow capacity of the pump against closed discharge conditions.

Dual Integral Relief Valves may be manifolded for bi-directional pump rotation offering protection in both flow directions.

In-Line Bypass Valves

Ebsray In-Line Bypass Valves are ideally suited for return-to-tank applications and where Integral Relief Valves would be unsuitable e.g. to reduce heat build up due to short circuit recirculation within the pump on high pressure high flow applications.

Ebsray In-Line PFM (Pressure and Flow Modulating) Valves are ideal for applications where constant pressure, flow control or remote operation is required e.g. filling line/packaging applications.

PFM Valves may be hydraulically or pneumatically actuated to maintain preset system conditions responding to manual or automatic external control.

Ebsray Integral (bolt-on) Relief Valve

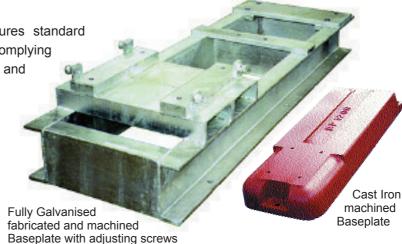

Ebsray RV Series In-line PFM (Pressure and Flow Modulating) Valve

### **Baseplates**

Ebsray designs and manufactures standard Baseplates and Baseplates complying with API 676 or other standards and

specifications as required.

Ebsray engineered Baseplates are fabricated to exacting requirements and machined to precise tolerances ensuring accurate alignment of pump, driver, transmission etc.

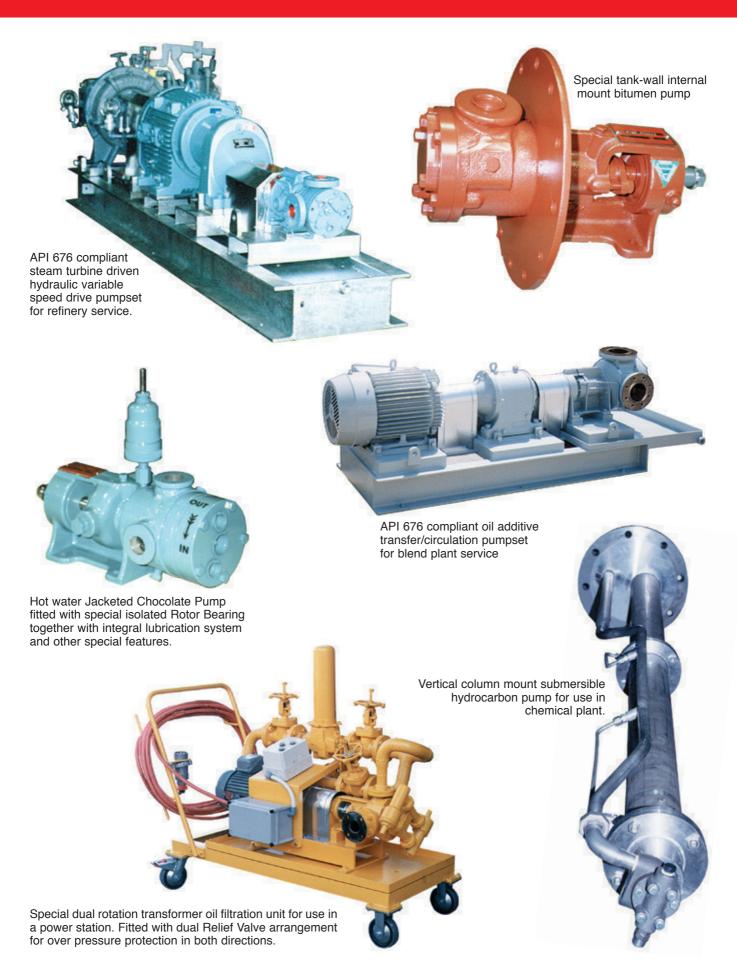

for ease of drive alignment

## **Arrangements**

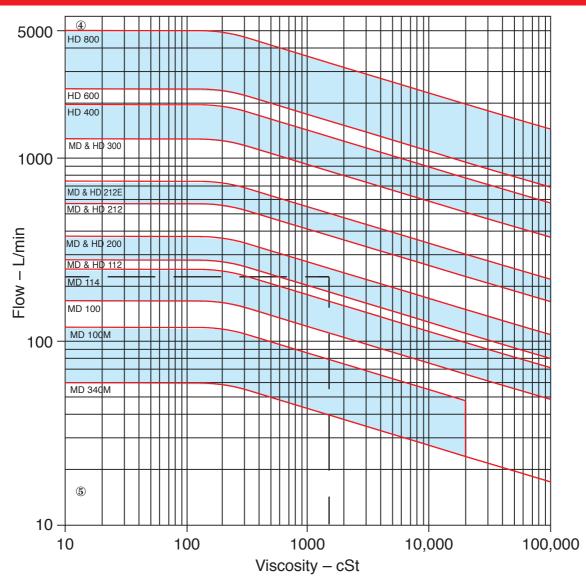

Customised Pumps and Pumpset arrangements designed and manufactured by Ebsray to suit customer and system requirements.

# **Arrangements**

## **Pump Size Selection**

For quick selection of the most economical size MD or HD Series pump, knowing the flow (L/min) and the Kinematic Viscosity (cSt), refer to the pump size selection graph above.

Example: (Follow dotted line above)
To find the ideal pump size for:
Flow = 220 L/min
Kinematic Viscosity = 1500 cSt.

The intersection of the two dotted lines occurs in the area of the Model MD & HD 200 pump.

### Pump Duty Power/Speed Determination

To determine the duty power and speed, refer to the chart/graph of the specific pump Model selected.

The following Notes *must* be considered for correct determination:

### Notes:

 Model selection may be affected by discharge pressure (Casing pressure), Differential pressure (Bearing loading), Viscosity of product (Shaft size/torque limitations). Check with technical data, EBSRAY or your local Representative as required.

- 2. All pump models selected are dependant upon adequate  $\ensuremath{\mathsf{NPSH_A}}$  for correct, optimum performance and operation.
- 3. For Kinematic Viscosity greater than 10,000 cSt we recommend conferring directly with EBSRAY or a local Representative.
- 4. For Flows Greater than 5000 L/min, refer to EBSRAY or a local Representative.
- 5. For flows less than 10 L/min, refer to EBSRAY Z Series selection graph.
- Internal pump clearances will affect Hydraulic Slip.
   Therefore, Slip must be considered for final pump speed determination in *every* selection. Clearances will be determined by: a) pump casing/rotor materials selected, and/or, b) product temperature, and/or, c) product viscosity.
- 7. For applications involving Abrasive or Shear-Sensitive Liquids, refer to EBSRAY or a local Representative.

### Materials of Construction

This table of major components is general and some materials may only be available in specific models.

For special materials not outlined, or not shown as available, please contact EBSRAY or your local Representative.

Integral Relief Valves are supplied in materials suited to the pump construction and pumpage compatibility requirements.

(For In-Line type Bypass Valves refer to EBSRAY)

NOTE: Dimensions are subject to revision without notice. Certified data available on request

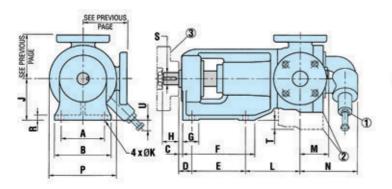

Note 1: Screwed Ports: Port Threads to AS 1722.1 All port threads female. e.g. RP  $1^{1}/4$  /  $32 = 1^{1}/4$ " BSP RP (parallel) 32mm DN

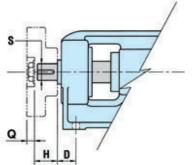

Note 2: Flanged Ports: ANSI CL125 to ANSI B16.1 or Table H to AS 2129 e.g. HD200 AS2129 / DN 50/ H

Flanged ports listed are to suit designated standard for Cast Iron Flanges. When Models listed above with CL125 ANSI flanges are made from Ductile Iron, Steel or Stainless Steel, they will have raised face flanges to suit CL150 ANSI B16.42 Standard. Port dimensions above may vary - check with EBSRAY for details. For other flange standards or alternative screwed port standards refer to EBSRAY.

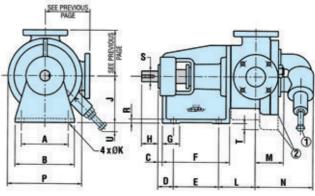

# **Dimensions** (continued)

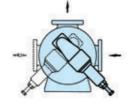

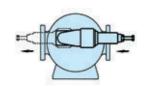

In the Pump Models marked 3 the coupling forms an integral part of the bearing locking mechanism, therefore, dimensions shown are critical for correct operation.

- ① In some pump models with 90° ports, the Relief Valve adjusting screw end may be below the pump mounting feet. (Dimension U)
- ② In some models, the underside of the pump Body may project below the pump mounting feet. (Dimension T)
